

STOP! By Excelbian, Software for Wireless. www.excelbian.com

Install manual and description.

Version 1.0.1 - Freeware.

For Nokia 9500 and 9300 (Symbian O.S.)

STOP! is a program by Robert Harmsen and André van Wieringen (www.pdatotaal.info.)

What is STOP!

The idea of STOP! is simple: it only avoids that people see the (screen) content of your Nokia Communicator when they just open the cover. Once activated, a full screen size pop-up window appears, hiding your device's content. The STOP! screen contains a small input field for entering a password. If the correct password is entered, the STOP! pop-up screen disappears, and your normal screen will be visible again. STOP! is auto activated again next time you close and open the cover of your Communicator.

STOP! has not been developed as a utility for secure locking of your device. It is a simple process, but it will STOP! other people to have a quick look in your personal Nokia Communicator.

Installation.

STOP! is distributed as a single .SIS file and can be easily installed by using PC Suite or by transferring the .SIS file manually to your Nokia 9500/9300 Communicator.

On the PC: use the Nokia Application Installer in PC Suite, or just double click the .SIS file from it's location and follow the instructions..

On the Nokia 9500 or 9300 Communicator: just locate the .SIS file and open. Follow the instructions and continue the installation.

After installation: go to your Configuration settings, and find the STOPControl icon in Extra's, Choose, and select "Activate", fill in your personal Password (Tip: use only one or two symbols, works fastest, no one knows anyway ;-), and click OK.
